# General Relativity , Energy , Mass and Infinitely Extended Particles 

Jamshid Ghasimi<br>Professor Hessaby Foundation documents@hessaby.com Jgh1001@yahoo.com

## 1.Introduction

As we know, theories of elementary particles for calculating particles' masses are less successful.

Many people have attempted to achieve a way to calculate particles' masses [1] ,[2] . But none of them could present an analytic way for all states of particles. They merely could present limited ways, without a basic expression. Mahmoud Hessaby [3] , the professor of Tehran university, when he studied in Paris university ( 1923 -1927) , began to study about sensitivity of photoelectric cells and elementary particles. His supervisor was professor Fabry [4] while defending his PhD thesis, and one of his classmates was famous scientist , " Louis De Broglie " [5].

Dr.Hessaby studied De broglies's theory ( wave-particle property of matter ) and general relativity for the first time in 1925 .

He continued his studies with Albert Einstein's supervision , in Princeton university and with Enrico Fermi [6] , in Chicago , from 1946 to 1949.

He focused on elementary particles, general relativity, fields theory and energy density.

Later in 1977 , he presented his study results on calculation of energy density and particles' masses.

## 2. Basic considerations

In general relativity , curvature of space, and line elements are as below :

$$
\begin{equation*}
G_{\mu v}=\frac{8 \pi G}{c^{4}} T_{\mu v} \tag{1}
\end{equation*}
$$

where $G_{\mu \nu}$ is curvature of space tensor, G is Newton's constant, c is light velocity and $T_{\mu \nu}$ is stress-energy tensor.

In a flat spacetime, ordinary velocity of particles are ;

$$
\begin{equation*}
u=\frac{d x}{d t} e_{x}+\frac{d y}{d t} e_{y}+\frac{d z}{d t} e_{z} \tag{2}
\end{equation*}
$$

$\left\{e_{x}, e_{y}, e_{z}\right\}$ are basis vectors, as well as orthonormal basis.
According to the relativistic description, particles exist in a four dimensional spacetime , the basis vectors would be $\left\{e_{t}, e_{x}, e_{y}, e_{z}\right\}$.

In this description, the ordinary velocity of particles is not a vector.
Instead one defines a four-velocity ;

$$
\begin{equation*}
u=-c \frac{d t}{d \tau} e_{t}+\frac{d x}{d \tau} e_{x}+\frac{d y}{d \tau} e_{y}+\frac{d z}{d t} e_{z} \tag{3}
\end{equation*}
$$

Where $\tau$ is the proper time of the particle, i.e. the time is measured by a standard clock carried by the particle using Einstein's summation convention, we may write ;

$$
U=U^{\mu} e_{\mu}=\frac{d x^{3}}{d \tau} e_{\mu} \quad, x^{\mu} \in\left\{x^{0}, x^{1}, x^{2}, x^{3}\right\}
$$

Where $x^{0}=c t, x^{1}=x, x^{2}=y, x^{3}=y$.
If $\frac{d t}{d \tau}=\gamma$, then ;

$$
\begin{gather*}
U=\gamma\left(c, u^{x}, u^{y}, u^{z}\right)  \tag{4}\\
U=\gamma(c, u) \tag{5}
\end{gather*}
$$

In the next frame of the particle, $\mathrm{u}=\mathrm{o}$ and $\gamma=1$.
Hence the four-velocity reduces to :

$$
\begin{equation*}
U=c e_{t} \tag{6}
\end{equation*}
$$

In this frame, the particle moves in the time direction with the velocity of light.
The four-momentum , P, of a particle with rest-mass $m_{o}$ is defined by;

$$
\begin{equation*}
\mathrm{P}=m_{o} \mathrm{U} \tag{7}
\end{equation*}
$$

The ordinary three-dimensional relativistic momentum of the particle is ;

$$
\begin{equation*}
\mathrm{P}=\mathrm{mu}=\gamma m_{o} \mathrm{u} \tag{8}
\end{equation*}
$$

From Eqs.(6) and (8), follows;

$$
\begin{equation*}
P=(E / C, p) \tag{9}
\end{equation*}
$$

Where the total energy of the particle is , E .
The four-force, or the Minkowski [7] force F is defined by ;

$$
\begin{equation*}
\mathrm{F}=\frac{d P}{d \tau} \tag{10}
\end{equation*}
$$

The ordinary force f is ;

$$
\begin{equation*}
\mathrm{f}=\frac{d P}{d t} \tag{11}
\end{equation*}
$$

It follows that ;

$$
\begin{equation*}
\mathrm{F}=\gamma\left(\frac{d E}{c d t}, \frac{d P}{d t}\right)=\gamma\left(\frac{f \cdot u}{c}, \mathrm{f}\right) \tag{12}
\end{equation*}
$$

In the rest frame of the particle ;

$$
\begin{equation*}
F_{0}=\left(0, f_{0}\right) \tag{13}
\end{equation*}
$$

Where $f_{0}$ is the Newtonian force on the particle , The four-acceleration " A " of the particle is ;

$$
\begin{equation*}
\mathrm{A}=\frac{d \mathrm{U}}{d \tau} \tag{14}
\end{equation*}
$$

In the case that the rest mass is constant we get ;

$$
\begin{equation*}
A=\frac{1}{m_{o}} F \tag{15}
\end{equation*}
$$

The ordinary acceleration "a" is ;

$$
\begin{equation*}
a=\frac{d u}{d t} \tag{16}
\end{equation*}
$$

Using that ;

$$
\begin{equation*}
F=m_{o} \frac{d}{d t}(\gamma u)=\gamma m_{o}\left(a+\gamma^{2} \frac{u . a}{c^{2}} u\right) \tag{17}
\end{equation*}
$$

We find from Eqs.(12) , (14) and (17) ;

$$
\begin{equation*}
A=\gamma^{2}\left(\gamma^{2} \frac{u \cdot a}{c}, a+\gamma^{2} \frac{u \cdot a}{c^{2}} u\right) \tag{18}
\end{equation*}
$$

The component expressions (12) and (18) are valid only with respect to an orthonormal basis field .

Curved space one can always introduces local Cartesian coordinate systems with orthonormal basis coordinate vector fields .

Line-element of Minkowski [7] spacetime in spherical coordinates has the form ( in units with $\mathrm{c}=1$ ) ;

$$
\begin{equation*}
d s^{2}=-d t^{2}+d r^{-2}+r^{-2}\left(d \theta^{2}+\sin ^{2} \theta d \phi^{2}\right) \tag{19}
\end{equation*}
$$

To solve the field equation for empty spacetime with static and spherically symmetric 3 -space is reasonable to assume that the line-element can be written ;

$$
\begin{equation*}
d s^{2}=-f(\bar{r}) d t^{2}+g(\bar{r}) d \bar{r}^{2}+h(\bar{r}) \bar{r}^{2}\left(d \theta^{2}+\sin ^{2} \theta d \phi^{2}\right) \tag{20}
\end{equation*}
$$

With a new radial coordinate $r=\bar{r} \sqrt{h(\bar{r})}$, line-element becomes;

$$
\begin{equation*}
d s^{2}=-A(r) d t^{2}+B(r) d r^{2}+r^{2}\left(d \theta^{2}+\sin ^{2} \theta d \phi^{2}\right) \tag{21}
\end{equation*}
$$

To replace the functions $A(r)$ and $B(r)$ by exponential functions in order to obtain somewhat simpler expressions for the components of the Einstein's tensor, we can use the following :

$$
e^{2 a(r)}=A(r) \text { and } e^{2 \beta(r)}=B(r)
$$

We find;

$$
\begin{equation*}
d s^{2}=-e^{2 \alpha} d t^{2}+e^{2 \beta} d r^{2}+r^{2}\left(d \theta^{2}+\sin ^{2} \theta d \phi^{2}\right) \tag{22}
\end{equation*}
$$

These coordinates are called Schwarzschild coordinates .
Professor Hessaby assumed the line-element as below ;

$$
\begin{equation*}
d s^{2}=-e^{\delta_{1}} d t^{2}-e^{a_{1}} d r^{2} r^{2}\left(e^{\beta_{1}} d \theta^{2}+e^{\gamma_{1}} \sin ^{2} \theta d \phi^{2}\right) \tag{23}
\end{equation*}
$$

After to compare eqs.(22) and (23) we will find ;

$$
e^{\delta_{1}}=-e^{2 \alpha_{1}}, e^{\alpha_{1}}=-e^{2 \beta_{1}}, e^{\beta_{1}}=-1, e^{\gamma_{1}}=-1
$$

In general relativity (GR), the relationship between matter and the curvature of spacetime is contained in equation, which is Einstein's equation.

$$
\begin{equation*}
R_{\mu \nu}-\frac{1}{2} R g_{\mu \nu}=\frac{8 \pi G T_{\mu \nu}}{c^{4}} \tag{24}
\end{equation*}
$$

Where $\mathrm{R} \mu \nu$ is Ricci curvature tensor, R is scalar curvature, $\mathrm{g} \mu \nu$ is metric tensor, G is Newtone's constant, c is light velocity and $\mathrm{T}_{\mu \nu}$ is stress-energy tensor .

We could use eqs.(24) as below ;

$$
\begin{equation*}
\mathrm{T}_{\mu \nu}=\frac{c^{4}}{8 \pi G}\left(\mathrm{R}_{\mu \nu}-\frac{1}{2} \mathrm{Rg}_{\mu \nu}\right) \tag{25}
\end{equation*}
$$

And we write ;

$$
\begin{equation*}
a=\frac{+c^{4}}{2 G} \tag{26}
\end{equation*}
$$

where $a$ is a dimensional constant .
And then we find ;

$$
\begin{equation*}
\mathrm{T}_{\mu \nu}=\frac{a}{4 \pi}\left(\mathrm{R}_{\mu \nu}-\frac{1}{2} \mathrm{Rg}_{\mu \nu}\right) \tag{27}
\end{equation*}
$$

The contracted energy tensor is :

$$
\begin{equation*}
\mathrm{T}=\mathrm{U}=\sum \mathrm{u}_{\mu \nu}=\sum \mathrm{T}_{\mu \nu} \tag{28}
\end{equation*}
$$

Since we have identically $\mathrm{U}=0$, the identification of $\mathrm{T}_{\mu}^{v}$ with $\mathrm{U}_{\mu}^{\nu}$, gives by contraction ;

$$
\begin{equation*}
\mathrm{U}=\mathrm{T}=\frac{a}{4 \pi} \mathrm{R}=0 \tag{29}
\end{equation*}
$$

So that we have identically $R=0$.

Taking account of (29) , relation (27) becomes,

$$
\begin{equation*}
\mathrm{U}_{\mu \nu}=\mathrm{T}_{\mu \nu}=\frac{a}{4 \pi} \mathrm{R}_{\mu \nu} \tag{30}
\end{equation*}
$$

With refer to Professor Hessaby's paper, $\mathrm{U}_{\mu \nu}$ would be,

$$
\begin{equation*}
U_{11}=-U_{22}=-U_{33}=U_{44}=\frac{1}{4 \pi} E^{-\left(\alpha_{1}+\delta_{1}\right)} \times\left(F_{14}\right)^{2} \tag{31}
\end{equation*}
$$

Where $\mathrm{F}_{\mu \nu}$ is generalized field on gravitational, electric, and nuclear fields .
Relations (30) and (31) give ;

$$
\begin{equation*}
\mathrm{R}_{11}=-\mathrm{R}_{12}=-\mathrm{R}_{23}=\mathrm{R}_{44}=\frac{1}{a} \mathrm{e}^{-\left(\alpha_{1}+\delta_{1}\right)}\left(\mathrm{F}_{14}\right)^{2} \tag{32}
\end{equation*}
$$

$\mathrm{R}_{\mu \nu}$ is in terms of $\alpha_{1}, \beta_{1}, \gamma_{1}, \delta_{1}$.
The components $\mathrm{T}_{\mu \nu}$ of the energy-momentum tensor, or sometimes the stressenergy tensor, are " the flux of the $\mu^{\text {th }}$ component of momentum in the $v^{\mu h}$ direction."

When we are in vaccum- no energy or momentum , $\mathrm{T}_{\mu \nu}=0$ and becomes Einstein's equation in vaccum ;

$$
\begin{equation*}
\mathrm{R}_{\mu \nu}=0 \tag{33}
\end{equation*}
$$

This is somewhat easier to solve than the full equation. Although the full nonlinear Einstein's equation looks simple, in application it is not. If we recall the definition of the Riemann [8] tensor in terms of the Christoffel symbols, and the definition of those in terms of the metric, we will realize that Einstein's equation for the metric are complicated indeed.

Through christoffel symbols ( Non-vanishing symbols ) and by relations (29) the contracted tensor R is zero ;

$$
\begin{equation*}
\mathrm{R}=\sum R_{\mu \nu} \tag{34}
\end{equation*}
$$

Based on $\mathrm{R}_{22}=\mathrm{R}_{33}$, we assume the equality of $\beta_{1}$ and $\gamma_{1}$ (Refer to Professor Hessaby's paper )

Making use of the equality $\mathrm{R}_{11}=\mathrm{R}_{44}$, we obtain ;

$$
\begin{equation*}
e_{1}^{-\alpha}\left(\beta_{1}^{\prime \prime}+\frac{1}{2} \beta_{1}^{\prime 2}+2 \frac{\beta_{1}^{\prime}}{r}-\frac{1}{2} \alpha_{1}^{\prime} \beta_{1}-\frac{1}{2} \beta_{1}^{\prime} \delta_{1}^{\prime}-\frac{\alpha_{1}^{\prime}}{r}-\frac{\delta_{1}^{\prime}}{r}\right)=0 \tag{35}
\end{equation*}
$$

in the first case where $\beta_{1}=\gamma_{1}=\cdot$ (Professor Hessaby's paper ) and relation (35) gives then $\delta_{1}=-\alpha_{1}$, becomes;

$$
\begin{equation*}
\mathrm{e}^{\delta}{ }_{1}\left(-\delta_{1}^{\prime \prime}-\delta_{1}^{\prime 2}-4 \frac{\delta_{1}^{\prime}}{r}-\frac{2}{r^{2}}\right)+\frac{2}{r^{2}}=0 \tag{36}
\end{equation*}
$$

the solution

$$
\begin{equation*}
\mathrm{e}^{\delta}=\left(1+\frac{k}{r}\right)^{2} \tag{37}
\end{equation*}
$$

where k is a constant depending on mass of the particle and having the dimensions of a length, then we have ;

$$
\begin{equation*}
\mathrm{e}^{\alpha}=e^{-\delta}=\left(1+\frac{k}{r}\right)^{-2} \tag{38}
\end{equation*}
$$

We have assumed $\beta_{1}=\gamma_{1}=0$, the metric becomes,

$$
\begin{equation*}
\mathrm{ds}^{2}=-\frac{1}{\left(1+\frac{k}{r}\right)^{2}} \mathrm{dr}^{2}-\mathrm{r}^{2} \mathrm{~d} \theta^{2}-\mathrm{r}^{2} \sin ^{2} \theta \mathrm{~d} \theta^{2}+\left(1+\frac{k}{r}\right)^{2} d t^{2} \tag{39}
\end{equation*}
$$

In the second case, if we extend the validity of the equality $\delta_{1}=-\alpha_{1}$ to the general case where $\beta_{1} \neq 0$, the differential equation (35) reduces to ;

$$
\begin{equation*}
\beta_{1}^{\prime \prime}+\frac{1}{2} \beta_{1}^{\prime 2}+2 \frac{\beta_{1}^{\prime}}{r}=0 \tag{40}
\end{equation*}
$$

After solving the equation above the metric conclusion, changes into :

$$
\begin{equation*}
\mathrm{ds}^{2}=-\left(1+\frac{A}{r}\right)^{2}\left(\mathrm{dr} r^{2}+\mathrm{r}^{2} \mathrm{~d} \theta^{2}+\mathrm{r}^{2} \sin ^{2} \mathrm{~d} \theta^{2}\right)+\frac{1}{\left(1+\frac{A}{r}\right)^{2}} \mathrm{dt}^{2} \tag{41}
\end{equation*}
$$

## 3.The Fields

For gravitational field, we consider the form of the metric as found in (39). The four potential have known by $\phi_{\mu}$. The field in general case is given by the expression ;

$$
\begin{equation*}
\mathrm{F}_{\mu \nu}=\frac{\partial \phi_{\mu}}{\partial x_{\nu}}-\frac{\partial \phi_{\nu}}{\partial x_{\mu}} \tag{42}
\end{equation*}
$$

The field $\mathrm{F}_{14}$ is given by equ (31), which $\delta_{1}=-\alpha_{1}$

$$
\begin{equation*}
\mathrm{U}_{44}=\frac{1}{2 \pi} e^{-(\alpha+\delta)}\left(\mathrm{F}_{14}\right)^{2}=\frac{1}{4 \pi}\left(F_{14}\right)^{2} \tag{43}
\end{equation*}
$$

Also the energy density would be ;

$$
\begin{equation*}
\mathrm{U}_{44}=-\frac{a}{4 \pi} R^{44}=-\frac{a}{4 \pi} g^{44} R_{4}^{4}=-\frac{a}{4 \pi} e^{-\delta_{1}} R_{4}^{4} \tag{44}
\end{equation*}
$$

A result of equ .(44) , which $\delta_{1}=-\alpha_{1}$
And $\beta_{1}=\gamma_{1}=0$ is;

$$
\begin{equation*}
\mathrm{R}_{4}^{4}=e_{1}^{\delta}\left(-\frac{1}{2} \delta_{1}^{\prime \prime}-\frac{1}{2} \delta_{1}^{\prime}-\frac{\delta_{1}^{\prime}}{r}\right) \tag{45}
\end{equation*}
$$

If $e^{\delta_{1}}=\left(1+\frac{k}{r}\right)^{2}$, so that we have ;

$$
\begin{equation*}
\mathrm{R}_{4}^{4}=-\frac{k}{r^{4}} \tag{46}
\end{equation*}
$$

And then ;

$$
\begin{equation*}
\mathrm{F}_{14}=\frac{\sqrt{a} k}{r^{2}} \tag{47}
\end{equation*}
$$

The energy density , becomes ;

$$
U^{44}=\frac{a}{4 \pi} \frac{k^{2}}{r^{2}(r+k)^{2}}
$$

And the integral of energy density over the whole space is ;

$$
\begin{equation*}
\mathrm{W}=\frac{a}{4 a} k^{2} \int_{0}^{\infty} \frac{1}{r^{2}(r+k)^{2}} r^{2} \sin ^{2} \theta d \theta d \phi d r=a k \tag{48}
\end{equation*}
$$

The mass of the particle being " m " , must be equal to ;

$$
\begin{equation*}
\mathrm{ak}=\mathrm{mc}^{2} \tag{49}
\end{equation*}
$$

The dimension of " K " being that of a length, and for "a " must be a force .

We set ;

$$
\mathrm{a}=\frac{c^{4}}{G}
$$

(50)

$$
\mathrm{k}=\frac{G m}{c^{2}}
$$

We see that in the integral of energy density, we encounter no infinities, and the mass of the particle consists of the integral of its energy density overall space!

The metric (39) becomes now ;

$$
\begin{equation*}
\mathrm{ds}^{2}=-\frac{1}{\left(1+\frac{G m}{c^{2} r}\right)^{2}} d r^{2}-r^{2} d \theta^{2}-r^{2} \sin ^{2} \theta d \phi^{2}+\left(1+\frac{G m}{c^{2} r}\right)^{2} d t^{2} \tag{51}
\end{equation*}
$$

Einstein's Solution is ;

$$
\begin{equation*}
\mathrm{ds}^{2}=-\frac{1}{\left(1-\frac{2 m}{r}\right)} d r^{2}-r^{2} d \theta^{2}-r^{2} \sin ^{2} \theta d \phi^{2}+\left(1-\frac{2 m}{r}\right) d t^{2} \tag{52}
\end{equation*}
$$

In the metric (51), the $g_{\mu \nu}$ are perfect squares, and also do not have any singularities apart from the origin, giving with a finite value for the energy of the particle!

In the electric field we consider the metric (41) , and for the energy density is ;

$$
\begin{equation*}
\mathrm{u}^{44}=-\frac{b}{4 \pi} R^{44}=\frac{1}{4 \pi} e^{-(\alpha+\delta)}\left(F_{14}\right)^{2} \tag{53}
\end{equation*}
$$

Since we have $\alpha_{1}=\beta_{1}=\gamma_{1}=-\delta_{1}$, we get ;

$$
\begin{equation*}
R^{44}=e_{1}^{\delta_{1}}\left(-\frac{1}{2} \delta_{1}^{\prime \prime}-\frac{\delta_{1}^{\prime}}{r}\right) \tag{54}
\end{equation*}
$$

Replacing $e^{\delta_{1}}$ by $\left(1+\frac{A}{r}\right)^{-2}$ we find ;

$$
\begin{equation*}
\mathrm{R}^{44}=-\frac{A^{2}}{(r+A)^{4}} \tag{55}
\end{equation*}
$$

So that

$$
\begin{equation*}
\mathrm{R}^{44}=-\frac{1}{b}\left(F_{14}\right)^{2}=-\frac{A^{2}}{(r+A)^{4}} \tag{56}
\end{equation*}
$$

And,

$$
\begin{equation*}
u^{44}=-\frac{b A^{2}}{4 \pi(r+A)^{4}} \tag{57}
\end{equation*}
$$

The integral over all space is ;

$$
\begin{equation*}
\int u^{44} d v=\frac{b A}{3} \tag{58}
\end{equation*}
$$

We know,

$$
\begin{equation*}
\frac{b A}{3}=m c^{2} \tag{59}
\end{equation*}
$$

"A" has the dimension of length, and " b " must have the dimension of a force. We remark that the $\frac{e^{2}}{m c^{2}}$ has dimension of a length, and the combination $\frac{m^{2} c^{4}}{e^{2}}$ has the dimension of a force. we set ,

$$
\begin{align*}
& \mathrm{b}=\frac{9 m^{2} c^{4}}{e^{2}} \\
& \mathrm{~A}=\frac{1}{3} \frac{e^{2}}{m c^{2}} \tag{60}
\end{align*}
$$

The " A " is equal to ;

$$
\begin{equation*}
\mathrm{A}=\frac{e^{2}}{3 m e^{2}}=\frac{1}{3} \frac{e^{2}}{\hbar c} \frac{\hbar^{0}}{m c}=\frac{1}{3} \alpha \lambda=0.9393 \times 10^{-3} \mathrm{~m} \tag{61}
\end{equation*}
$$

When he was 18, he entered the Ecole Polytechnique in Paris and , after graduating two years later, returned to his native Marseille for his Agrégé de physique (1889) . After his agrégation , which gave him the license to teach at any State secondary school, Fabry taught at Lycées in Pau , Nevers, Bordeaux, and Marseille, and finally at the Lycées Saint Louis in Paris. During this time he was preparing his doctoral dissertation on the theory of multibeam interference phenomena , a topic that had been treated as early as 1831 by George Biddell Airy ( 1801 1892 ) , but not with the depth and sophistication Fabry brought to the subject. In the years 1890-1892 Fabry published two papers on the visibility and orientation of interference fringes, the first of which was a joint paper with his mentor, Professor Jules Macé de Lepinay, and the second, which was accepted by the Faculty of Science at the University of Paris for his Docteur és sciences degree. These papers and the large number that soon followed gradually established Fabry as an authority in the field of optics and spectroscopy .

In 1894 Fabry replaced Alfred Pérot (1863-1925) as Maitre de Conférences (Lecturer ) at the University of Marseille, where he spent the next 26 years, starting as an assistant in de Lepinay's laboratory . In 1904 , when de Lepinary retired, Fabry was appointed to fill his post as Professor of Physics at Marseille.
